

Remark 1. This is very trivial.

Proof by Triviality. Trivial.

 $\triangle$ 

# $Theorem\ 1-HelloWorld$

This is NOT a theorem.

### Definition 1 – Byebye

This is DEFINITELY a theorem.

## Chapter 1: Non-Trivial Chapter

Recall that we have already explained in lecture that all rational function of a single variable can be integrated in finite terms. Starting from there, we introduce integrals of the form, known as the **binomial integrals**:

(1) 
$$J_{p,q} = \int (a+bz)^p z^q \, \mathrm{d}z, a, b \in \mathbb{R}, p, q \in \mathbb{Q}.$$

This exercise aims at studying the rationalization of the binomial integral, as well as some of its applications.

### Question 1

Assume that  $p \in \mathbb{Z}$ , rationalise the integrand.

9

Since  $q \in \mathbb{Q}$ , this implies there exists  $m \in \mathbb{Z}$ ,  $n \in \mathbb{N}$  such that  $q = \frac{m}{n}$ . Then,  $J_{p,q}$  can be written as

$$J_{p,q} = \int (a+bz)^p z^{\frac{m}{n}} \, \mathrm{d}z.$$

Let  $z = x^n$ , then  $dz = n \cdot x^{n-1} dx$ . Replace z with x we have

$$J_{p,q} = \int (a+b\cdot x^n)^p \cdot (x^n)^{\frac{m}{n}} \cdot n \cdot x^{n-1} dx.$$

Simplify it and we get

$$J_{p,q} = n \int (a + b \cdot x^n)^p \cdot x^{m+n-1} dx.$$

Now, by binomial theorem we can see the integrand is rationalised, as needed.

#### Lemma 1

This is a lemma.

This is a math environment.

**(** 

## Corollary 1

This is a corollary.

#### Exercise 2

## Question 1

We can see the question counter is auto reset to 1 when we start a new exercise / chapter / unit.

*Proof.* Proof by alittlebear.cls code, left as an exercise to the reader :)
